                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ELLE/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      EDIN/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit composition or none
containers, the composition described above; (3) an isolated nucleic acid
molecule which encodes a NOVX protein of the invention; (4) a vector
comprising the nucleic acid molecule described above; (5) a cell
comprising the nucleic acid molecule described above; (5) a cell
comprising the nucleic acid molecule described above; (6) a cell
comprising the above vector; (6) an antibody that immunospecifically
binds to the polypeptide described above; (7) methods for determining the
presence or amount of the above polypeptide or nucleic acid molecule in a
ample; (8) methods for identifying a potential therapeutic agent for
comprising the above polypeptide or nucleic acid molecule in a
polypeptide or nucleic acid molecule in a first mammalian subject; (9) a
method of identifying an agent that binds to the polypeptide described
above; (10) a method for identifying a potential therapeutic agent for
use in treating a pathology that is related to an aberrant expression or
aberrant physiological interactions of the polypeptide; (11) a method of
acreening for a modulator of activity or of latency or predisposition to
compression of activity or of activity or of latency or predisposition to
a pathology associated with the polypeptide; (12) a method for modulating
the activity of the polypeptide described above; (13) methods of treating
or preventing a pathology associated with the above polypeptide in a
mammal; and (14) a method for producing the above polypeptide in a
mammal; and (14) a method for producing the above polypeptide in a
mammal; and (14) a method for producing the above polypeptide in a
mammal; and (14) a method for producing the above polypeptide or the nucleic
acid molecule may be used to diagnose, treat or prevent metabolic
disorders such as diabetes or obesity, infections, cachexia, cancer
alsorders such as

Human stratum corneum chymotrophic recombinant enzyme (SCCE).

```
The invention relates to isolated NoVX polypeptides and polymucleotides.

NoVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the abstract expression and activity of NoVX polypeptides. For example, NoVX polypeptides and activity of NoVX by supplementing the patient our polymucleotides may be used to treat disorders associated with decreased to polymucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of crestorative therapy. NoVX polypeptides may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of crestorative therapy. NoVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NoVX. The anti-NoVX polypeptide antibodies, agonists and antagonists may also be used as anti-NoVX polypeptides. The anti-NoVX polypeptide antibodies, diabetes, obesity, infectious diagnose and treat: metabolic disorders, diabetes, obesity, infectious diagnose and treat: metabolic disorders, diabetes, obesity, infectious disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, haematopoietic disorders, and the various dyslipidaemias, metabolic creased with obesity, the metabolic syndrome X and disorders associated with obesity, the metabolic syndrome X and contexting disorders associated with obesity, the metabolic syndrome X and contexting disorders associated with obesity, the metabolic syndrome X and contexting disorders associated vith chosents and probable of a human NoVX protein.

They may also be used as antibacterial agents. The present sequence of a human NoVX protein.
                                                                                                                                                                                                                                                                                                                              Dipippo VA;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                           hypothetical protein At2945740 [imported] - Arabidopsis thaliana
NyAlternate names: hypothetical protein F4118.28
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Accession: T02473; C84894
C;Accession: T02473; C84894
R;Rounsley, S.D.; Lin, X.; Ketchum, K.A.; Crosby, M.L.; Brandon, R.C.; Sykes, S.M.; Kaulsubmitted to the EMBL Data Library, August 1998
A;Description: Arabidopsis thaliana chromosome II BAC F4118 genomic sequence.
A;Reference number: Z14674
A;Accession: T02473
A;Status: translated from GB/EMBL/DDBJ

Isold=P49862-2; Sequence=VSP_013581;
TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermis. Also expressed in the brain, mammary gland, cerebellum, spinal cord and kidney. Lower levels in salivary gland, cerebellum, spinal cord and kidney. Lower levels in salivary glands, uterus, thymus, thyroid, placenta, trachea and testis. Up-regulated in ovarian carcinoma, especially late-stage serous carcinoma, compared with normal ovaries and benign adenomas (at the protein level).
INDUCTION: By estrogens and glucocorticoids in a breast carcinoma
                                                           chymotryptic enzyme. For the control of the control of the continuous blookys. Res. Commun. 211:586-589(1995).

-i- FUNCTION: May catalyze the degradation of intercellular cohesive structures in the cornified layer of the skin in the continuous shedding of cells from the skin surface. Specific for amino acid residues with aromatic side chains in the Pl position. SCCE cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-|-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation of precursors to inflammatory cytokines.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

GENERAL INFORMATION:
APPLICANT: O'BETION, Timothy J.
APPLICANT: Underwood, Lowell J.
TITLE OF INVENTION: TADG-12: A No. 6291663el Transmembrane Serine Protease
TITLE OF INVENTION: Overexpressed in Ovarian Carcinoma
FILE REFERENT = 16192
CURRENT APPLICATION NUMBER: US/09/261,416A

CURRENT FILING DATE: 1999-03-03

NUMBER OF SEQ ID NOS: 14

SEQ ID NO 7

LENGTH: 154
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         OTHER INFORMATION: Serine protease catalytic domain of stratum corneum OTHER INFORMATION: chymotryptic enzyme (Scce) homologous to similar OTHER INFORMATION: domain in TADG-12 US-03-261-416-7

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Diagnosing cancer comprises detecting stratum corneum chymotrypsin enzyme

Claim 25; Page 102; 127pp; English.

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide

Sequence 9 AA;

Novel human diagnostic protein #23369.

A peptide of the invention acts as a stratum corneum chymotrytic enzyme inhibitor. The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or at risk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligonucleotide is useful for treating a neoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or pancreatic cancer, and other cancers in which SCCE is overexpressed. The peptides are also useful in the monitoring and development of immunotherapies for ovarian and other malignancies. The present sequence represents a peptide fragment of serine protease SCCE (stratum corneum corneum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of stratum corneum chymotrytic enzyme (SCCE) peptides, for vaccinating an individual against SCCE, and in monitoring and developing immunotherapies for ovarian and other malignancies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human stratum corneum chymotrytic enzyme peptide fragment SEQ ID NO:33.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed control of (II) or to treat disease states involving (II). (II) is activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a cupypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein espression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations creponable for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in all patent did not appear in the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and conjunction to the aberrant expression and polymucleotides may be used to treat disorders associated with decreased computed to five the aberiant our control or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polymucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of crestorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NOVX. polypeptides and in assays to identify with the constant and antigens in the anti-NOVX polypeptide antibodies, agonists and antagonists may also be used to modulate NOVX polypeptide expression and activity of NOVX polypeptides. The anti-NOVX polypeptide antibodies may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious collegence, anomer, and the various dyslipidaemias, metabolic disorders, disease, parkenson, and the various dyslipidaemias, metabolic disorders, and the various dyslipidaemias, metabolic wasting disorders and the various dyslipidaemias, metabolic wasting disorders and the various dyslipidaemias, metabolic wasting disorders and the various diseases and various cancers. Created with obesity, the metabolic sequence of a human NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            human; NOVX; antidiabetic; anorectic; antibacterial; virucide; immunomodulator; cytostatic; nootropic; neuroprotective; antipaemic; gene therapy; human disease; metabolic disorder; diabetes; obseity; infection; cachexia; cancer; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyslipidaemia.

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics

Claim 1; Page 169-170; 586pp; English.

The process of the composition comprising a polypeptide described above and a carrier; (2) a kit comprising in one or more containers, the composition described above; (3) an isolated nucleic acid described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above comprising the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a disease associated with altered levels of expression of the above comprising an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of corrivity of the polypeptide described above; (12) a method for modulating corrective, of the polypeptide described above; (13) methods of treating or predisposition to a pathology associated with the above polypeptide. Novx correctivity of the polypeptide described above; (13) methods of treating corrective, animalial and (14) a method for producing the above polypeptide. Novx correctivity or of the polypeptide described above; (13) methods of creating corrective, animalial and antilipaemic activities, and can be used in gene therapy. The colypeptide is useful in manufacturing a medicament for treating a capture of activities and can be used in gene therapy. The colypeptide is useful in manufacturing a medicament for treating a capturing a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic. neurodegenerative disorders such as Alzheimer's disease or Parkinson's The present invention describes NOVX proteins, where X can be 1 to 55

AAR67888; RESULT 8 AAR67888 RESULT ន្តដូច្ចប្រជុំ ò g ઠે 셤 The invention relates to isolated NoVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NoVX polypeptides. For example, NoVX polypeptides and activity of NoVX by supplementing the patient our production or activity of NoVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NoVX polypeptides by binding with the cells own genes and preventing their expression. NoVX binding with the cells own genes and preventing their expression. NoVX polypeptides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of cretorative indiagnostic and in assays to identify modulators captured antibodies and in assays to identify of NoVX. The anti-NoVX polypeptide antibodies, agonists and antagonists and antagonists and antagonists and antagonists and antagonists and antagonist of solve to modulate NoVX polypeptide antibodies, agonists and antagonists may also be used to modulate NoVX polypeptide antibodies and presence of NoVX in samples. NoVX polypeptides and polymucleotide expression and activity of NoVX polypeptides and polymucleotides may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious disorders, anorexia, cancer, cancer, cancer associated cachexia, neurodegenerative disorders, and the various dyslipidaemias, metabolic disorders, haematopoletic disorders, parkinson's Disorder, inample and disorders, disturbances associated with obesity, the metabolic syndrome X and Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X;

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneuw chymotryptic enzyme (SCCE) or its variant, or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or testing of a cosmetic or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an apportant dispenses scleeted from diseases consisting of epidermal hyperkeratosis, epidermal inflammator, dermal inflammator, skin diseases scleeted from diseases suth epidermal hyperkeratosis. The mammal of the invention is also useful as a model for further studies of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the N-terminal Erymonymous with human kallikrein 7 (KLKX), used in the development of the
                                                                                                                                                                                                                                                                                                                                                                                    Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 6; Page 37; 74pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAT39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. E. coli) or eukaryotic and testing of cods. useful for treating or develop products for the design and testing of cods. useful for treating or preventing conditions associated with beta-amyloid peptide, esp. Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SCCE; human; stratum corneum chymotryptic enzyme; kallikrein 7; serine protease; transgenic mammal; skin; skin disease; skin cancer; hyperkeratosis; acanthosis; epidermal inflammation; dermal inflammation; pruritus; atopic dermatitis; eczema; acne; itch; KLK7; enzyme.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a bratum corneum chymotryptic enzyme (SCCE) or its variant, coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, coperably linked to a promoter that drives expression of heterologous soce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or tacting of a cosmetic or a pharmaceutical formulation, and for the development of a disgnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of inflammatory skin diseases selected from diseases consisting of epidermal hyperkeratosis, epidermal inflammation, dermal inflammation, erratum stopic dermatitis, eczema, acrome and inherited skin diseases with the paldermal hyperkeratosis. The mammal of the invention is also useful as a model for further studies of itch mechanisms and the testing of where itch is a component. This sequence represents the human stratum corneum chymotryptic enzyme, SCCE which is a serine protease synonymous corneum chymotryptic enzyme, SCCE which is a serine protease synonymous corneum chymotryptic enzyme, invention in the development of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; protease; cancer; immune-related disorder; cardiovascular disease; neuronal-associated disease; metabolic disorder; inflammatory disorder; nervous system disorder; sexual dysfunction; pain; mood disorder;
                                                                                                                                                                                                                                                                                                                                                                                             Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 40; DB 5; Length 253; 100.0%; Pred. The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. inflammatory diseases and asthma), cardiovascular diseases (e.g. restenosis and coronary thrombosis), brain or neuronal associated diseases, metabolic coronary thrombosis), brain or neuronal associated diseases, metabolic diseases, migraines, pain, sexual dysfunction, mood disorders (e.g. rheumatoid arthritis and psoriasis), central or peripheral nervous system diseases, migraines, pain, sexual dysfunction, mood disorders, attention disorders, hypotension, hypertension, psychotic disorders, neurological disorders (e.g. Alzheimer's disease, Parkinson's disease) and dyskinesias. The nucleic acids and polypeptides are also useful for treating viral infections caused by human immunodeficiency virus (HIV), and non-viral infections such as ocular disease (e.g. glaucoma) and macular degeneration. AAU82702-AAU82760 represent the novel
                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acids encoding novel human proteases, useful for useful for treating diseases and disorders such as cancers, immune-related diseases and disorders, cardiovascular disease (e.g. restenosis) and inflammatory
hypertension; psychotic disorder; neurological disorder; dyskinesia; viral infection; human immunodeficiency virus; HIV; non-viral infection; ocular disease; cytostatic; enzyme.

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a semple comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample comprises prostate cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves contextention in a subject having a prostate cancer, which involves the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. (I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer. (I) is also useful for identifying agent under conditions effective for the test agent to modulate a biological activity of the polypeptide differentially-regulated in prostate cancer cells, which involves contacting a polypeptide differentially regulated in prostate cancer cells, which involves contacting a polypeptide differentially regulated in prostate cancer cells, which involves contacting a polypeptide of the polypeptide, and determining whether the test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, subjudy determining predisposition to disease conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer e.g., in tissue sections, in blopsy sample, in total RNA, in lymph, in cell cancer its seage of development, the nature of genetic defect, etc. The polypeptide encoded by (I) can be used as target for therapy or drug of seconditic genes, and groups of genes, expressed in pathways or the polypeptide ancoded by (I) can be used as target for therapy or the polypeptide encoded by (I) can be used as target for therapy or the polypeptide encoded by (I) can be used as target for the polypeptide encoded by (I) can 
                                                                                                                                                                                                                                                                                                                                                                  Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Page 293-294; 416pp; English.

(ORIG-) ORIGENE TECHNOLOGIES INC.

ö Jay Sun Z, WPI; 2003-058520/05. N-PSDB; ABX10375. Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

Claim 1; Page 351; 416pp; English.

The invention describes genee (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer. Which involves contering the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. Of target genes which are differentially-regulated in prostate cancer. (C) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer. (C) activity of a polypeptide differentially-regulated in prostate cancer calls with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (I) is useful as molecular markers, as drug targets, and for detecting, prognostical activity of the polypeptide, and conditions especially relating to prostate cancer. (I) and its expression conditions especially relating to prostate cancer. (I) and its expression conditions especially relating to prostate cancer. (I) and its expression of cancer, its stage of development, the nature of genetic defect, etc. (T) the polypeptide end diagnostic test to assay for presence of cancer of cancer, its stage of development, the nature of genetic defect, etc. (T) the polypeptide end diagnostic test to describe the type of cancer, its stage of development, the nature of genetic defect, etc. (T) the polypeptide end development, the nature of genetic defect, etc. (T) the polypeptide end groups of genes are type to development, the polypeptide and these sections in biopsy sample, in total NN, in Inyally the polypeptide end ge regulated in prostate cancer

The invention relates to a novel isolated polynucleotide. The polynucleotides of the invention have cytostatic activity, and may have a use in gene therapy, and in a vaccine. The composition and methods are useful in diagnosing and/or treating cancer, particularly ovarian cancer. The composition may also be used as a vaccine to prevent cancer. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotide and polypeptide useful for diagnosing and/or treating cancer, particularly ovarian cancer, and as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human stratum corneum chymotryptic enzyme - ovarian cancer clone O1676P.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; cytostatic; gene therapy; vaccine; cancer; ovarian cancer

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 2

hypothetical protein PAB0088 - Pyrococcus abyssi (strain Orsay)

Organization process abyses:
C;Species: Pyrococcus abyses:
C;Date: 20-Aug-1999 #sequence\_revision 20-Aug-1999 #text\_change 09-Jul-2004
C;Accession: H75201
A;Rescription: Pyrococcus abyses genome sequence: insights into archaeal chromosome struct
A;Rescription: Pyrococcus abyses genome sequence: insights into archaeal chromosome struct
A;Rescription: Pyrococcus abyses genome sequence: insights into archaeal chromosome struct
A;Reserince number: A75001
A;Reserince rumber: A75001
A;Residues: preliminary
A;Molecule 'type: DWA
A;Residues: 1-146 <KAM>A;Residues: 1-140 <KAMA
